Three ways to guide the eye

How do A, B, and C guide the eye in different ways?

WHAT IS VISIBLE

A uses a saturated yellow subject against blue. B places a bright opening within a dark architectural frame. C distributes attention through open space and a quieter palette.

A · ColorB · LightC · Space

NAME THE PATTERN

Visual hierarchy

Glossary-backed · Attention and composition

Save term

Why it works

Contrast creates a perceptual order. The strongest difference attracts attention first; quieter regions make that difference easier to see. [A] [B]

Try it in your own interface

Choose one primary action. Give it the strongest local contrast, reduce competing accents, and check whether the first glance lands where you intended.

What remains uncertain

These frames show composition, not interaction timing. They do not establish the creator’s intent or how the design performs with users.

A

Color as a focal point

Whole image · Saved locally

Objects & spaces

color · contrast · composition

The chair becomes a focal point through the yellow–blue contrast.

Select region

Open original

Why does this draw my eye?

A attached · Evidence reviewed

↑

Contrast makes a focal point

WHAT IS VISIBLE · A

The yellow chair separates strongly from the blue ground. Its position and color give the eye a clear place to land.

Visual hierarchy · Glossary-backed

Use a strong local difference to make one element read first. Keep nearby elements quieter so they support that focus.

Try this

Give one primary action the strongest contrast. Check the result at a glance before adding more accents.
